Principles in Economics and Mathematics: the mathematical part

Bram De Rock

Practicalities about me

- Bram De Rock
- Office: R.42.6.218
- E-mail: bderock@ulb.ac.be
- Phone: 02 650 4214
- Mathematician who is doing research in Economics
- Homepage: http://www.revealedpreferences.org/bram.php

A (10) A (10) A (10)

Practicalities about the course

- 12 hours on the mathematical part
- Micael Castanheira: 12 hours on the economics part
- Slides are available at MySBS and on http://mathecosolvay.com/spma/
- Course evaluation
 - Written exam to verify if you can apply the concepts discussed in class
 - Compulsory for students in Financial Markets
 - On a voluntary basis for students in Quantitative Finance

< (□) < 三 > (□)

Course objectives and content

- Refresh some useful concepts needed in your other coursework
 - No thorough or coherent study
 - Interested student: see references for relevant material
- Content:
 - Calculus (functions, derivatives, optimization, concavity)
 - Pinancial mathematics (sequences, series)
 - Linear algebra (solving system of linear equations, matrices, linear (in)dependence)
 - Fundamentals on probability (probability and cumulative distributions, expectations of a random variable, correlation)

3 Financial mathematics

4 Linear algebra

Motivation Functions of one variable Functions of more than one variable Optimization

Role of functions

- Calculus = "the study of functions"
- Functions allow to exploit mathematical tools in Economics
- E.g. make consumption decisions
 - max $U(x_1, x_2)$ s.t. $p_1 x_1 + p_2 x_2 = Y$
 - Characterization: $x_1 = f(p_1, p_2, Y)$
 - Econometrics: estimate f
 - Allows to model/predict consumption behavior
- Warning about identification
 - Causality: what is driving what?
 - Functional structure: what is driving the result?
 - Does the model allow to identify

Motivation Functions of one variable Functions of more than one variable Optimization

Some important functions of one variable

- The straight line: y = A + Bx
 - A is the intercept or intersection with the y- axis
 - B is the slope
 - The impact of changes in x is constant
 - E.g. the effect on demand of a price change
- Polynomial functions: $y = A_n x^n + \cdots + A_0$
 - Quadratic and cubic functions are special cases
 - Non-linear functions to capture more advance patterns due to changes in *x*
 - E.g. profit as a function of sold quantities
- Hyperbolic functions: $y = \frac{A}{x}$
 - The impact of changes in x goes to infinity around zero

Motivation Functions of one variable Functions of more than one variable Optimization

Some important functions of one variable

- Exponential functions: a^x and e^x
 - Used as growth (a > 1) or decay curves (0 < a < 1)
 - Always positive
 - The relative growth/decay remains constant
 - E.g. the growth of capital at constant interest rate
 - Remember: $a^{x}a^{y} = a^{x+y}$, $(a^{x})^{y} = a^{xy}$ and $a^{0} = 1$
- Logarithmic functions: $\log_a(x)$ or $\ln(x)$
 - The inverse of the exponential function: y = log_a(x) if and only if a^y = x
 - Can only be applied to positive numbers
 - Remember: $\log_a(xy) = \log_a(x) + \log_a(y)$, $\log_a(\frac{x}{y}) = \log_a(x) - \log_a(y)$, $\log_a(x^k) = k \log_a(x)$ and $\log_a(1) = 0$

< 口 > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Motivation Functions of one variable Functions of more than one variable Optimization

Derivatives

- Marginal changes are important in Economics
 - The impact of a infinitesimally small change of one of the variables
 - Comparative statistics: what is the impact of a price change?
 - Optimization: what is the optimal consumption bundle?
- Marginal changes are mostly studied by taking derivatives
- Characterizing the impact depends on the function
 - $f: D \subseteq \mathbb{R}^n \to \mathbb{R}^k : (x_1, \ldots, x_n) \mapsto (y_1, \ldots, y_k) = f(x_1, \ldots, x_n)$
 - We will always take k = 1
 - First look at n = 1 and then generalize
 - Note: $\mathbb{N} \subset \mathbb{Z} \subset \mathbb{Q} \subset \mathbb{R} \subset \mathbb{C}$

Motivation Functions of one variable Functions of more than one variable Optimization

2 Calculus

- Motivation
- Functions of one variable
- Functions of more than one variable
- Optimization

Financial mathematics

4 Linear algebra

Motivation Functions of one variable Functions of more than one variable Optimization

Functions of one variable: $f : D \subseteq \mathbb{R} \to \mathbb{R}$

$$\frac{df}{dx} = f' = \lim_{\Delta x \to 0} \frac{f(x + \Delta x) - f(x)}{\Delta x}$$

- Limit of quotient of differences
- If it exists, then it is called the derivative
- f' is again a function
- E.g. $f(x) = 3x^2 4$
- E.g. discontinuous functions, border of domain, f(x) = |x|

Motivation Functions of one variable Functions of more than one variable Optimization

Some important derivatives and rules

Let us abstract from specifying the domain D and assume that $c, n \in \mathbb{R}_0$

• If
$$f(x) = cx^{n}$$
, then $f'(x) = ncx^{n-1}$

• If
$$f(x) = ce^x$$
, then $f'(x) = ce^x$

• If
$$f(x) = c \ln(x)$$
, then $f(x) = c \frac{1}{x}$

•
$$(f(x) \pm g(x))' = f'(x) \pm g'(x)$$

•
$$(f(x)g(x))' = f'(x)g(x) + f(x)g'(x) \neq f'(x)g'(x)$$

•
$$(\frac{f(x)}{g(x)})' = \frac{f'(x)g(x) - f(x)g'(x)}{g(x)^2}$$

Motivation Functions of one variable Functions of more than one variable Optimization

• • • • • • • • • • • •

Application: the link with marginal changes

- By definition it is the limit of changes
- Slope of the tangent line
 - Increasing or decreasing function (and thus impact)
 - Does the inverse function exist?
- First order approximation in some point c
 - Based on expression for the tangent line in c
 - $f(c + \Delta x) \approx f(c) + f'(c)(\Delta x)$
 - More general approximation: Taylor expansion

Motivation Functions of one variable Functions of more than one variable Optimization

• • • • • • • • • • • •

Application: elasticities

- The elasticity of f in x: $\frac{f'(x)x}{f(x)}$
- The limit of the quotient of changes in terms of percentage
 - Percentage change of the function: $\frac{f(x+\Delta x)-f(x)}{f(x)}$
 - Percentage change of the variable: $\frac{\Delta x}{x}$

• Quotient:
$$\frac{f(x+\Delta x)-f(x)}{\Delta x} \frac{x}{f(x)}$$

- Is a unit independent informative number
 - E.g. the (price) elasticity of demand

Motivation Functions of one variable Functions of more than one variable Optimization

Application: comparative statics for a simple market model

- Demand: $P = \frac{10}{4} \frac{Q}{4}$ or Q = 10 4P
- Supply: $P = \frac{Q}{\alpha} \frac{2}{\alpha}$ or $Q = 2 + \alpha P$

•
$$P^* = \frac{8}{4+\alpha}$$
 and $Q^* = \frac{8+10\alpha}{4+\alpha}$

•
$$\frac{dP^*}{d\alpha} = \frac{-8}{(4+\alpha)^2}$$
 and $\frac{dQ^*}{d\alpha} = \frac{32}{(4+\alpha)^2}$

• The (price) elasticity of demand is $-\frac{-4P}{10-4P}$

Motivation Functions of one variable Functions of more than one variable Optimization

Some exercises

- Compute the derivative of the following functions (defined on $\mathbb{R}^+)$
 - $f(x) = 17x^2 + 5x + 7$

•
$$f(x) = -\sqrt{x+3}$$

•
$$f(x) = \frac{1}{x^2}$$

•
$$f(x) = 17x^2e^x$$

•
$$f(x) = \frac{x\ln(x)}{x^2 - 4}$$

• Let $f(x) : \mathbb{R} \to \mathbb{R} : x \mapsto x^2 + 5x$.

- Determine on which region f is increasing
- Is f invertible?
- Approximate *f* in 1 and derive an expression for the approximation error
- Compute the elasticity in 3 and 5

Motivation Functions of one variable Functions of more than one variable Optimization

The chain rule

Often we have to combine functions

• If z = f(y) and y = g(x), then z = h(x) = f(g(x))

- We have to be careful with the derivative
- A small change in x causes a chain reaction
 - It changes y and this in turn changes z
- That is why $\frac{dz}{dx} = \frac{dz}{dy}\frac{dy}{dx} = f'(y)g'(x)$
 - Don't be confused: these are not fractions
 - Can easily be generalized to compositions of more than two functions

•
$$\frac{dz}{dx} = \frac{dz}{dy}\frac{dy}{du}\cdots\frac{dv}{dx}$$

Motivation Functions of one variable Functions of more than one variable Optimization

• • • • • • • • • • • •

Higher order derivatives

- The derivative is again a function of which we can take derivatives
- Higher order derivatives describe the changes of the changes
- Notation
 - f''(x) or more generally $f^{(n)}(x)$
 - $\frac{d}{dx}(\frac{df}{dx})$ or more generally $\frac{d^n}{dx^n}f(x)$

• E.g. if $f(x) = 5x^3 + 2x$, then $f'''(x) = f^{(3)}(x) = 30$

Motivation Functions of one variable Functions of more than one variable Optimization

Application: concave and convex functions

$$f: D \subset \mathbb{R}^n \to \mathbb{R}$$

f is concave

- $\forall x, y \in D, \forall \lambda \in [0, 1] : f(\lambda x + (1 \lambda)y) \ge \lambda f(x) + (1 \lambda)f(y)$
- If $n = 1, \forall x \in D : f''(x) \le 0$

f is convex

- $\forall x, y \in D, \forall \lambda \in [0, 1] : f(\lambda x + (1 \lambda)y) \le \lambda f(x) + (1 \lambda)f(y)$
- If $n = 1, \forall x \in D : f''(x) \ge 0$

< 口 > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Motivation Functions of one variable Functions of more than one variable Optimization

Application: concave and convex functions

- Very popular and convenient assumptions in Economics
 - E.g. optimization
- Sometimes intuitive interpretation
 - E.g. risk-neutral, -loving, -averse
- Don't be confused with a convex set
 - S is a set $\Leftrightarrow \forall x, y \in S, \forall \lambda \in [0, 1] : \lambda x + (1 \lambda)y \in S$

Motivation Functions of one variable Functions of more than one variable Optimization

Some exercises

- Compute the first and second order derivative of the following functions (defined on $\mathbb{R}^+)$
 - $f(x) = -\pi$
 - $f(x) = -\sqrt{5x} + 3$

•
$$f(x) = e^{-3x}$$

•
$$f(x) = \ln(5x)$$

•
$$f(x) = x^3 - 6x^2 + 17$$

Determine which of these functions are concave or convex

< 口 > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Bram De Rock Mathematical principles

Motivation Functions of one variable Functions of more than one variable Optimization

Functions of more than one variable: $f : D \subseteq \mathbb{R}^n \to \mathbb{R}$

- Same applications in mind but now several variables
 - E.g. what is the marginal impact of changing *x*₁, while controlling for other variables?
- Look at the partial impact: partial derivatives

•
$$\frac{\partial}{\partial x_i} f(x_1, \dots, x_n) = f_{x_i} = \lim_{\Delta x_i \to 0} \frac{f(x_1, \dots, x_i + \Delta x_i, \dots, x_n) - f(x_1, \dots, x_i, \dots, x_n)}{\Delta x_i}$$

Same interpretation as before, but now fixing remaining variables

• E.g.
$$f(x_1, x_2, x_3) = 2x_1^2 x_2 - 5x_3$$

• $\frac{\partial}{\partial x_1} f(x_1, x_2, x_3) = 4x_1 x_2$
• $\frac{\partial}{\partial x_2} f(x_1, x_2, x_3) = 2x_1^2$
• $\frac{\partial}{\partial x_3} f(x_1, x_2, x_3) = -5$

Motivation Functions of one variable Functions of more than one variable Optimization

Partial derivative

- Geometric interpretation: slope of tangent line in the x_i direction
- Same rules hold
- Higher order derivatives

•
$$\frac{\partial^2}{\partial x_i^2} f(x_1, \dots, x_n)$$

•
$$\frac{\partial^2}{\partial x_i x_j} f(x_1, \dots, x_n) = \frac{\partial^2}{\partial x_j x_i} f(x_1, \dots, x_n)$$

• E.g.
$$\frac{\partial^2}{\partial x_1^2} f(x_1, x_2, x_3) = 4x_2 \text{ and } \frac{\partial^2}{\partial x_i \partial x_3} f(x_1, x_2, x_3) = 0$$

Motivation Functions of one variable Functions of more than one variable Optimization

Some remarks

• Gradient:
$$\nabla f(x_1, \ldots, x_n) = (\frac{\partial f}{\partial x_1}, \ldots, \frac{\partial f}{\partial x_n})$$

• Chain rule: special case

•
$$x_1 = g_1(t), \dots, x_n = g_n(t)$$
 and $f(x_1, \dots, x_n)$
• $h(t) = f(x_1, \dots, x_n) = f(g_1(t), \dots, g_n(t))$
• $\frac{dh(t)}{dt} = h'(t) = \frac{\partial f(x_1, \dots, x_n)}{\partial x_1} \frac{dx_1}{dt} + \dots + \frac{\partial f(x_1, \dots, x_n)}{\partial x_n} \frac{dx_n}{dt}$
• E.g. $f(x_1, x_2) = x_1 x_2$, $g_1(t) = e^t$ and $g_2(t) = t^2$
• $h'(t) = e^t t^2 + e^t 2t$

Motivation Functions of one variable Functions of more than one variable Optimization

Some remarks

- Slope of indifference curve of f(x₁, x₂)
 - Indifference curve: all (x_1, x_2) for which $f(x_1, x_2) = C$ (with *C* some give number)
 - Implicit function theorem: $f(x_1, g(x_1)) = C$

•
$$\frac{\partial}{\partial x_1} f(x_1, x_2) + \frac{\partial}{\partial x_2} f(x_1, x_2) \frac{dg}{dx_1} = 0$$

• Slope $- \frac{\partial}{\partial x_1} f(x_1, x_2)$

Siope =
$$-\frac{\partial x_1}{\partial x_2}f(x_1,x_2)$$

Motivation Functions of one variable Functions of more than one variable Optimization

Some exercises

 Compute the gradient and all second order partial derivatives for the following functions (defined on ℝ⁺)

•
$$f(x_1, x_2) = x_1^2 - 2x_1x_2 + 3x_2^2$$

•
$$f(x_1, x_2) = \ln(x_1 x_2)$$

•
$$f(x_1, x_2, x_3) = e^{x_1 + 2x_2} - 3x_1x_3$$

• Compute the marginal rate of substitution for the utility function $U(x_1, x_2) = x_1^{\alpha} x_2^{\beta}$

Motivation Functions of one variable Functions of more than one variable Optimization

Optimization: important use of derivatives

- Many models in economics entail optimizing behavior
 - Maximize/Minimize objective subject to constraints
- Characterize the points that solve these models
- Note on Mathematics vs Economics
 - Profit = Revenue Cost
 - Marginal revenue = marginal cost
 - Marginal profit = zero

Motivation Functions of one variable Functions of more than one variable Optimization

Optimization: formal problem

 $\max / \min f(x_1, \dots, x_n)$ s.t. $g_1(x_1, \dots, x_n) = c_1$ \dots $g_m(x_1, \dots, x_n) = c_m$ $x_1, \dots, x_n \ge 0$

- Inequality constraints are also possible
- Kuhn-Tucker conditions

Necessity and sufficiency

- Necessary conditions based on first order derivatives
 - Local candidate for an optimum
- Sufficient conditions based on second order derivatives
- Necessary condition is sufficient if
 - The constraints are convex functions
 - E.g. no constraints, linear constraints, ...
 - The objective function is concave: global maximum is obtained
 - The objective function is convex: global minimum is obtained
 - Often the "real" motivation in Economics

Motivation Functions of one variable Functions of more than one variable **Optimization**

Necessary conditions

Free optimization

No constraints

•
$$f'(x^*) = 0$$
 if $n = 1$

•
$$\frac{\partial}{\partial x_i} f(x_1^*, \dots, x_n^*) = 0$$
 for $i = 1, \dots, n$

Intuitive given our geometric interpretation

Motivation Functions of one variable Functions of more than one variable **Optimization**

Necessary conditions

- Optimization with positivity constraints
 - No g_i constraints
 - On the boundary extra optima are possible
 - Often ignored: interior solutions

•
$$x_i^* \ge 0$$
 for $i = 1, ..., n$

•
$$x_i^* \frac{\partial}{\partial x_i} f(x_1^*, \dots, x_n^*) = 0$$
 for $i = 1, \dots, n$

• $\frac{\partial}{\partial x_i} f(x_1^*, \dots, x_n^*) \le 0$ for all $i = 1, \dots, n$ simultaneously OR $\frac{\partial}{\partial x_i} f(x_1^*, \dots, x_n^*) \ge 0$ for all $i = 1, \dots, n$ simultaneously

Optimization

Necessary conditions

Constrained optimization without positivity constraints 3

- Define Lagrangian: $L(x_1, \ldots, x_n, \lambda_1, \ldots, \lambda_m) =$ $f(x_1, \dots, x_n) - \lambda_1(g_1(x_1, \dots, x_n)) - \dots - \lambda_m(g_m(x_1, \dots, x_n))$ • $\frac{\partial}{\partial x_i} L(x_1^*, \dots, x_n^*, \lambda_1^*, \dots, \lambda_m^*) = 0$ for all $i = 1, \dots, n$
- $\frac{\partial}{\partial \lambda_i} L(x_1^*, \ldots, x_n^*, \lambda_1^*, \ldots, \lambda_m^*) = 0$ for all $j = 1, \ldots, m$
- Alternatively: $\nabla f(x_1^*, \ldots, x_n^*) =$ $\lambda_1^* \nabla g_1(x_1^*,\ldots,x_n^*) + \cdots + \lambda_m^* \nabla g_m(x_1^*,\ldots,x_n^*)$
- Some intuition: geometric interpretation
- Lagrange multiplier = shadow price

 - Motivation
 - Sequences and series
 - Application: net present value

4 Linear algebra

• • • • • • • • • • • •

Motivation Sequences and series Application: net present value

- A sequence is simply an infinite list of numbers
 - a_1, a_2, a_3, \ldots

Often there is a systematic pattern

There is formula describing the sequence

• E.g.
$$1, \frac{1}{2}, \frac{1}{3}, \dots$$
 or $a_n = \frac{1}{n}$

Motivation Sequences and series Application: net present value

Two useful types of sequences

- Arithmetic sequence: $a_n = a + (n-1)d$
 - *a*, *a* + *d*, *a* + 2*d*, . . .
 - There is a constant difference between the terms
 - E.g. -3, -1, 1, 3, ...
 - E.g. weekly evolution of the stock if the firm does not sell and produces *d* units every week
- Geometric sequence $a_n = ar^n 1$
 - *a*, *ar*, *ar*², . . .
 - The ratio between the terms is constant
 - E.g. 7, 14, 28, ...
 - E.g. yearly evolution of capital at constant interest rate

Motivation Sequences and series Application: net present value

- A series is the sum of all the terms of a sequence
- This can be a finite number or an infinite number

• E.g.
$$1 + 2 + 3 + \cdots = +\infty$$

• E.g.
$$1 + \frac{1}{2} + \frac{1}{3} + \dots = +\infty$$

• E.g.
$$1 + \frac{1}{2} + \frac{1}{4} + \dots = 2$$

- Partial sum *S_N* is the sum of the first *N* elements of the sequence
 - Finite version of the series
 - Evolves to the series if N gets bigger

Motivation Sequences and series Application: net present value

Two useful types of series

- Arithmetic series
 - Sum of arithmetic sequence: $a_n = a + (n-1)d$
 - Partial sum:

 $S_N = Na + (1 + 2 + \dots + N - 1)d = Na + \frac{N(N-1)}{2}d$

- Series is useless: 0 or $\pm \infty$, depending on *d* and *a*
- Geometric series
 - Sum of geometric sequence: $a_n = ar^{n-1}$
 - Partial sum: $S_N = a(1 + r + \dots + r^{N-1}) = a \frac{1 r^N}{1 r}$
 - Series: $\frac{a}{1-r}$ if |r| < 1, else $\pm \infty$

Motivation Sequences and series Application: net present value

Exercises

- Consider the sequence 26, 22, 18, ...
 - Give the sum of the first 8 elements
 - Give a formula for the partial sums
- Consider the sequence $\frac{1}{3}, \frac{1}{9}, \frac{1}{27}, \ldots$
 - Give the sum of the first 8 elements
 - Give a formula for the partial sums
- Let *a_n* be an arithmetic sequence for which the sum of the first 12 terms is 222 and the sum of the first 5 terms is 40. What is the general formula of this sequence?
- Let a_n be a geometric sequence for which the fourth term is 56 and the sixth term is $\frac{7}{8}$. What is the series of this sequence?

< 同 > < 回 > .

5 Fundamentals of probability theory

• • • • • • • • • • • •

Motivation Sequences and series Application: net present value

Compounded interest

- Compound interest on yearly basis
 - Assume capital K and yearly interest rate of r%
 - You receive interests only at the end of the year
 - Capital after N years: $K(1 + r)^N$
 - I.e. interest on interests also matter
- Interest is compounded several times per year
 - *m* times per year you receive interests
 - Of course the interest rate is adapted: <u>r</u>
 - Capital after one year: $K(1 + \frac{r}{m})^m$
 - More capital since more interests on interests

▲ 同 ▶ → 三 ▶

Motivation Sequences and series Application: net present value

Compounded interest

Interest is compounded continuously

- Often used in Macro
- m goes to infinity
- Capital after one year: Ke^r
- Note $Ke^r > K(1 + \frac{r}{m})^m > K(1 + r)$
 - Nominal interest rate is r
 - Annual percentage rate: $(1 + \frac{r}{m})^m 1$ or $e^r 1$
- Depreciation calculations are very similar
 - Depreciation rate r
 - Use 1 r instead of 1 + r

A (1) > A (2) > A

Motivation Sequences and series Application: net present value

Net present value

- 1000 Euro in 2014 does not have the same value as 1000 Euro in 2024
- We need to discount future amounts to make them comparable
 - We use compounded interest to do this
- Example
 - Assume interest rate at saving accounts is 2% and you receive interests on a yearly basis
 - Capital K after 10 years: K(1.02)¹⁰
 - 820, $35(1.02)^{10} = 1000$ or $820.35 = \frac{1000}{(1.02)^{10}}$
 - The discounted value of the 1000 Euro of 2024 is 820.35

• • • • • • • • • • • • •

Motivation Sequences and series Application: net present value

Evaluating investments

- Assume that an investment of *K* Euro will give a yearly return of 1000 Euros for the next 5 years
- For which *K* is this an interesting investment if the interest rate is 2%
- Answer
 - We need to discount the 1000 Euro of every year
 - $\frac{1000}{1.02} + \frac{1000}{(1.02)^2} + \dots + \frac{1000}{(1.02)^5} = \frac{1000}{1.02} (1 + \frac{1}{1.02} + \dots + \frac{1}{(1.02)^4})$
 - Geometric sequence/series: $\frac{1000}{1.02} \frac{1 - (\frac{1}{1.02})^5}{1 - \frac{1}{1.02}} = 1000 \frac{1 - (\frac{1}{1.02})^5}{0.02} = 4713.46$
 - So K should be less than 4713.46 Euro to make this investment profitable

< ロ > < 同 > < 回 > < 回 >

Motivation Sequences and series Application: net present value

Consider a stock or bond that gives you a yearly dividend of 10 Euro

- Assume that you receive dividends for 10 years, what is the price you want to pay for this stock/bond if the interest rate is 2% (compounded yearly)?
- Assume now that you receive dividends forever, what is then the price you want to pay?
- Due to uncertainty, you want to add a risk premium of 2%, meaning that you now discount with 4% instead of 2%.
 What is the impact on both prices?

Motivation Matrix algebra The link with vector spaces Application: solving a system of linear equations

Matrices

$$A = (a_{ij})_{i=1,...,n;j=1,...,m} = \begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1m} \\ a_{21} & a_{22} & \cdots & a_{2m} \\ \vdots & \vdots & \cdots & \vdots \\ a_{n1} & a_{n2} & \cdots & a_{nm} \end{pmatrix}$$

•
$$a_{ij} \in \mathbb{R}$$
 and $A \in \mathbb{R}^{n imes m}$

- *n* rows and *m* columns
- Square matrix if *n* = *m*
- Notable square matrices
 - Symmetric matrix: $a_{ij} = a_{ji}$ for all i, j = 1, ..., n
 - Diagonal matrix: $a_{ij} = 0$ for all i, j = 1, ..., n and $i \neq j$
 - Triangular matrix: only non-zero elements above (or below)
 the diagonal

Motivation Matrix algebra The link with vector spaces Application: solving a system of linear equations

< ロ > < 同 > < 回 > < 回 >

Matrix manipulations

Let $A, B \in \mathbb{R}^{n \times m}$ and $k \in \mathbb{R}$

- Equality: $A = B \Leftrightarrow a_{ij} = b_{ij}$ for all $i, j = 1, \dots, n$
- Scalar multiplication: $kA = (ka_{ij})_{i=1,...,n;j=1,...,m}$
- Addition: $A \pm B = (a_{ij} \pm b_{ij})_{i=1,...,n;j=1,...,m}$

Dimensions must be equal

• Transposition: $A' = A^t = (a_{ji})_{j=1,...,m;i=1,...,n}$

•
$$A \in \mathbb{R}^{n \times m}$$
 and $A^t \in \mathbb{R}^{m \times n}$

•
$$(A \pm B)^t = A^t \pm B^t$$

•
$$(kA)^t = kA^t$$

•
$$(A^t)^t = A$$

Motivation Matrix algebra The link with vector spaces Application: solving a system of linear equations

Matrix multiplication

Let $A \in \mathbb{R}^{n \times m}$ and $B \in \mathbb{R}^{m \times k}$

- $AB = (\sum_{h=1}^{m} a_{ih} b_{hj})_{i=1,...,n;j=1,...,k}$
- Multiply the row vector of A with the column vector of B
 - Aside: scalar/inner product and norm of vectors
 - Orthogonal vectors
- Number of columns of A must be equal to number of rows of B
- $AB \neq BA$, even if both are square matrices

•
$$(AB)^t = B^t A^t$$

 - Verify which of the above matrices are idempotent
 - Find the value of α that makes the following matrix

idempotent:
$$\begin{pmatrix} -1 & 2 \\ \alpha & 2 \end{pmatrix}$$

Motivation Matrix algebra The link with vector spaces Application: solving a system of linear equations

Two numbers associated to square matrices: trace

Let $A, B, C \in \mathbb{R}^{n \times n}$

- Trace(A) = $tr(A) = \sum_{i=1}^{n} a_{ii}$
- Used in econometrics
- Properties
 - $tr(A^t) = tr(A)$
 - $tr(A \pm B) = tr(A) \pm tr(B)$
 - tr(cA) = ctr(A) for any $c \in \mathbb{R}$
 - tr(AB) = tr(BA)
 - tr(ABC) = tr(BCA) = tr(CAB) $\neq tr(ACB)(= tr(BAC) = tr(CBA))$

A (10) A (10) A (10)

Motivation Matrix algebra The link with vector spaces Application: solving a system of linear equations

Two numbers associated to square matrices: trace

Example

• Let
$$A = \begin{pmatrix} 3 & 6 \\ -1 & -2 \end{pmatrix}$$
 and $B = \begin{pmatrix} 1 & 2 \\ 3 & -1 \end{pmatrix}$
• Then $AB = \begin{pmatrix} 21 & 0 \\ -7 & 0 \end{pmatrix}$, $BA = \begin{pmatrix} 1 & 2 \\ 10 & 20 \end{pmatrix}$ and $A + B = \begin{pmatrix} 4 & 8 \\ 2 & -3 \end{pmatrix}$
• $tr(A) = 1$, $tr(B) = 0$ and $tr(A + B) = 1$
• $tr(AB) = 21 = tr(BA)$

Motivation Matrix algebra The link with vector spaces Application: solving a system of linear equations

< ロ > < 同 > < 回 > < 回 >

Two numbers associated to square matrices: determinant

Let $A \in \mathbb{R}^{n \times n}$

• If n = 1, then $det(A) = a_{11}$

• If
$$n = 2$$
, then
det(A) = $a_{11}a_{22} - a_{12}a_{21} = a_{11}\det(a_{22}) - a_{12}\det(a_{21})$

• If
$$n = 3$$
, then $\det(A) = a_{11} \det \begin{pmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{pmatrix} - a_{12} \det \begin{pmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{pmatrix} + a_{13} \det \begin{pmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{pmatrix}$

- Can be generalized to any n
- Works with columns too

Motivation Matrix algebra The link with vector spaces Application: solving a system of linear equations

• • • • • • • • • • • • •

Two numbers associated to square matrices: determinant

Let $A, B \in \mathbb{R}^{n \times n}$

- $det(A^t) = det(A)$
- $det(A \pm B) \neq det(A) \pm det(B)$
- $\det(cA) = c^n \det(A)$ for any $c \in \mathbb{R}$
- det(AB) = det(BA)
- A is non-singular (or regular) if A^{-1} exists

• I.e.
$$AA^{-1} = A^{-1}A = I_n$$

- In is a diagonal matrix with 1 on the diagonal
- Does not always exist
- det(A) ≠ 0

Motivation Matrix algebra The link with vector spaces Application: solving a system of linear equations

< ロ > < 同 > < 回 > < 回 >

Two numbers associated to square matrices: determinant

Example

• Let
$$A = \begin{pmatrix} 3 & 6 \\ -1 & -2 \end{pmatrix}$$
 and $B = \begin{pmatrix} 1 & 2 \\ 3 & -1 \end{pmatrix}$
• Then $AB = \begin{pmatrix} 21 & 0 \\ -7 & 0 \end{pmatrix}$, $BA = \begin{pmatrix} 1 & 2 \\ 10 & 20 \end{pmatrix}$ and $A + B = \begin{pmatrix} 4 & 8 \\ 2 & -3 \end{pmatrix}$

det(A) = 0, det(B) = −7 and det(A + B) = −28

• det(AB) = 0 = det(BA)

Motivation **Matrix algebra** The link with vector spaces Application: solving a system of linear equations

• Let
$$A = \begin{pmatrix} 2 & 4 & 5 \\ 0 & 3 & 0 \\ 1 & 0 & 1 \end{pmatrix}$$

• Compute tr(A) and det(-2A)

- Show that for any triangular matrix *A*, we have that det(*A*) is equal to the product of the elements on the diagonal
- Let $A, B \in \mathbb{R}^{n \times n}$ and assume that B is non-singular
 - Show that $tr(B^{-1}AB) = tr(A)$
 - Show that $tr(B(B^tB)^{-1}B^t) = n$
- Let $A, B \in \mathbb{R}^{n \times n}$ be two non-singular matrices
 - Show that AB is then also invertible
 - Give an expression for (AB)⁻¹

Motivation Matrix algebra **The link with vector spaces** Application: solving a system of linear equations

- **A**

Motivation Matrix algebra The link with vector spaces Application: solving a system of linear equations

A notion of vector spaces

- A set of vectors V is a vector space if
 - Addition of vectors is well-defined
 - $\forall a, b \in V : a + b \in V$
 - Scalar multiplication is well-defined
 - $\forall k \in \mathbb{R}, \forall a \in V : ka \in V$
- We can take linear combinations
 - $\forall k_1, k_2 \in \mathbb{R}, \forall a, b \in V : k_1a + k_2b \in V$
- E.g. \mathbb{R}^2 or more generally \mathbb{R}^n
- Ounterexample ℝ²₊

A (10) A (10)

Motivation Matrix algebra The link with vector spaces Application: solving a system of linear equations

Linear (in)dependence

Let *V* be a vector space

 A set of vectors v₁,..., v_n ∈ V is *linear dependent* if one of the vectors can be written as a linear combination of the others

•
$$\exists k_1, \ldots, k_{n-1} \in \mathbb{R} : v_n = k_1 v_1 + \cdots + k_{n-1} v_{n-1}$$

A set of vectors are *linear independent* if they are not linear dependent

• $\forall k_1, \ldots, k_n \in \mathbb{R} : k_1 v_1 + \cdots + k_n v_n = 0 \Rightarrow k_1 = \cdots = k_n = 0$

 In a vector space of dimension n, the number of linear independent vectors cannot be higher than n

Motivation Matrix algebra **The link with vector spaces** Application: solving a system of linear equations

Linear (in)dependence

Example

• \mathbb{R}^2 is a vector space of dimension 2

•
$$v_1 = (1,0), v_2 = (1,2), v_3 = (-1,4)$$
 and $v_4 = (2,4)$

- $v_3 = -3v_1 + 2v_2$, so v_1, v_2, v_3 are linear dependent
- $v_4 = 2v_2$, so v_2 , v_4 are linear dependent
- v₁, v₂ are linear independent
- *v*₃ is linear independent

Motivation Matrix algebra **The link with vector spaces** Application: solving a system of linear equations

Link with matrices: rank

```
Let A \in \mathbb{R}^{n \times m} and B \in \mathbb{R}^{m \times k}
```

- The row rank of A is the maximal number of linear independent rows of A
- The column rank of A is the maximal number of linear independent columns of A
- Rank of A = column rank of A = row rank of A
- Properties
 - $rank(A) \leq min(n, m)$
 - $rank(AB) \le min(rank(A), rank(B))$
 - $rank(A) = rank(A^tA) = rank(AA^t)$
 - If n = m, then A has maximal rank if and only if $det(A) \neq 0$

Motivation Matrix algebra The link with vector spaces Application: solving a system of linear equations

イロト イヨト イヨト イヨト

Link with matrices: rank

Example

• Let
$$A = \begin{pmatrix} 3 & 6 \\ -1 & -2 \end{pmatrix}$$
 and $B = \begin{pmatrix} 1 & 2 \\ 3 & -1 \end{pmatrix}$
• Then $AB = \begin{pmatrix} 21 & 0 \\ -7 & 0 \end{pmatrix}$, $BA = \begin{pmatrix} 1 & 2 \\ 10 & 20 \end{pmatrix}$
• $rank(A) = 1$ and $rank(B) = 2$

æ

Motivation Matrix algebra **The link with vector spaces** Application: solving a system of linear equations

• Let
$$A = \begin{pmatrix} 2 & 4 & 5 \\ 0 & 3 & 0 \\ 1 & 0 & 1 \end{pmatrix}$$

• Show in two ways that A has maximal rank

• Let
$$A, B \in \mathbb{R}^{n \times n}$$

- Show that there need not be any relation between rank(A + B), rank(A) and rank(B)
- Show that if *A* is invertible, then it needs to have a maximal rank

Using matrix notation

- *m* unknowns: *x*₁,..., *x_m*
- *n* linear constraints: $a_{i1}x_1 + \cdots + a_{im}x_m = b_i$ with $a_{i1}, \ldots, a_{im}, b_i \in \mathbb{R}$ and $i = 1, \ldots, n$

•
$$Ax = b$$

•
$$A = (a_{ij})_{i=1,...,n,j=1,...,m}$$

• $x = (x_i)_{i=1,...,m}$
• $b = (b_i)_{i=1,...,n}$

• Homogeneous if $b_i = 0$ for all i = 1, ..., n

Motivation Matrix algebra The link with vector spaces Application: solving a system of linear equations

• • • • • • • • • • • • •

Solving a system of linear equations

- Solve this by logical reasoning
 - Eliminate or substitute variables
 - Can also be used for non-linear systems of equations
 - Can be cumbersome for larger systems
- Use matrix notation
 - Gaussian elimination of the augmented matrix (A|b)
 - Can be programmed
 - Only for systems of linear equations
 - Theoretical statements are possible

Motivation Matrix algebra The link with vector spaces Application: solving a system of linear equations

・ロト ・ 四ト ・ ヨト ・ ヨト

$$\begin{cases} -x_1 + 4x_2 = 0\\ 2x_1 + 3x_2 = 5 \end{cases}$$

•
$$x_1 = 4x_2 \Rightarrow 11x_2 = 5 \Rightarrow x_2 = \frac{5}{11}$$
 and $x_1 = \frac{20}{11}$
• $\begin{pmatrix} -1 & 4 \\ 2 & 3 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} = \begin{pmatrix} 0 \\ 5 \end{pmatrix}$

• Take linear combinations of rows of the augmented matrix • Is the same as taking linear combinations of the equations • $\begin{pmatrix} -1 & 4 & | 0 \\ 2 & 3 & | 5 \end{pmatrix} \Rightarrow \begin{pmatrix} -1 & 4 & | & 0 \\ 0 & 11 & | & 5 \end{pmatrix} \Rightarrow \begin{pmatrix} -1 & 0 & | & \frac{-20}{11} \\ 0 & 11 & | & 5 \end{pmatrix}$

Motivation Matrix algebra The link with vector spaces Application: solving a system of linear equations

Theoretical results

Consider the linear system Ax = b with $A \in \mathbb{R}^{n \times m}$

- This system has a solution if and only if rank(A) = rank(A|b)
 - $rank(A) \le rank(A|b)$ by definition
 - Is the (column) vector *b* a linear combination of the column vectors of *A*?
 - If rank(A) < rank(A|B), the answer is no
 - If rank(A) = rank(A|B), the answer is yes
- The solution is unique if rank(A) = rank(A|B) = m

● n ≥ m

- There are ∞ many solutions if rank(A) = rank(A|B) < m
 - *n* < *m* or too many constraints are 'redundant'

Exercises

Solve the following systems of linear equations

•
$$\begin{cases} x_1 + 2x_2 + 3x_3 = 1\\ 3x_1 + 2x_2 + x_3 = 1 \end{cases} \text{ and } \begin{cases} x_1 - x_2 + x_3 = 1\\ 3x_1 + x_2 + x_3 = 0\\ 4x_1 + 2x_3 = -1 \end{cases}$$

• For which values of *k* does the following system of linear equations have a unique solution?

$$\begin{cases} x_1 + x_2 = 1\\ x_1 - kx_2 = 1 \end{cases}$$

(

- Consider the linear system Ax = b with $A \in \mathbb{R}^{n \times n}$
 - Show that this system has a unique solution if and only if A is invertible
 - Give a formula for this unique solution
- Show that homogeneous systems of linear equations always have a (possibly non-unique) solution

Motivation Univariate: one random variable Multivariate: several random variables

In econometrics/statistics we want

- To draw conclusions about a random variable X
 - Data Generating Process
 - Determines the random outcome for X
 - Possibly an infinite population
 - E.g. X is the income of a person
- And we can only use a limited set of observations
 - Due to randomness there is always uncertainty
 - Same holds because of the finite set of observations
 - E.g. we observe the income of 1000 persons

4 Linear algebra

- 5 Fundamentals of probability theory
 - Motivation
 - Univariate: one random variable
 - Multivariate: several random variables

Motivation Univariate: one random variable Multivariate: several random variables

Random variable

Let X be a random variable

- The outcome of a random data generating process
- Univariate versus multivariate
- Discrete versus continuous
 - Indivisible or countably infinite
- Probabilities are associated to the possible outcomes
 - Prob(X = x) or $Prob(a \le X \le b)$ with $a, b \in \mathbb{R}$
 - Probability distributions *f*(*x*)
- Examples
 - The outcome of the throw of a dice
 - The temperature on September 24

< 🗇 🕨 < 🖃 >

Motivation Univariate: one random variable Multivariate: several random variables

Probability density function (pdf)

Let X be a discrete random variable

• The probability density function is a function satisfying

•
$$f(x) = Prob(X = x)$$

•
$$0 \leq Prob(X = x) \leq 1$$

•
$$\sum_{x} f(x) = 1$$

- Formalizes our intuitive notion of probability
 - Has a direct interpretation
 - Probabilities are positive
 - Total probability cannot exceed 1
 - E.g. pick a random number out of {1,2,3}

▲ 同 ▶ → 三 ▶

Motivation Univariate: one random variable Multivariate: several random variables

• • • • • • • • • • • •

Probability density function (pdf)

Let X be a continuous random variable

• The probability density function f(x) is a function satisfying

•
$$Prob(a \le x \le b) = \int_a^b f(x) dx$$

•
$$f(x) \ge 0$$

•
$$\int_{-\infty}^{+\infty} f(x) dx = 1$$

- Extends our machinery to the continuous case
 - Because of indivisibility we have that Prob(X = x) = 0
 - Probabilities are surfaces (and positive by construction)
 - E.g. pick a random number in [0,1]

Motivation Univariate: one random variable Multivariate: several random variables

Cumulative distribution function (cdf)

• X is a discrete random variable

•
$$F(x) = \sum_{X \leq x} f(X) = \sum_{X \leq x} \operatorname{Prob}(X = x) = \operatorname{Prob}(X \leq x)$$

• X is a continuous random variable

•
$$F(x) = \int_{-\infty}^{x} f(t) dt$$

• $f(x) = \frac{dF(x)}{dx}$

Note

•
$$0 \leq F(x) \leq 1$$

- F is an increasing function
- $Prob(a \le X \le b) = F(b) F(a)$

Motivation Univariate: one random variable Multivariate: several random variables

Quantile function

- Quantile function *Q* is the "inverse function" of the cdf
- This function defines the relative position in the distribution
 - E.g. first quartile, second decile, median, ...
- X is a continuous random variable

- Or if F(x) = p, then $Prob(X \le Q(p)) = p$
- X is a discrete random variable
 - The cdf is a step function in the discrete case
 - If *F*(*x*) = *p*, then *Q*(*p*) is the smallest value for which *Prob*(*X* ≤ *Q*(*p*)) ≥ *p*

A (10) > A (10) > A

Motivation Univariate: one random variable Multivariate: several random variables

Measure of central tendacy

- The expected value or mean
 - $E(X) = \sum_{x} xf(x)$ if X is discrete
 - $E(X) = \int_X xf(x)dx$ if X is continuous
 - It the value that we expect on average
- The median is Med(X) = Q(0.5)
 - For symmetric distributions: mean \approx median
 - For right skewed distributions : mean > median
 - For left skewed distributions: mean < median
 - Less sensitive for outliers
- The mode is $\arg \max f(x)$
 - The value of X that has the highest probability of occurring

Motivation Univariate: one random variable Multivariate: several random variables

Measure of central tendacy

- Let g be an increasing function
 - $E(g(X)) \neq g(E(X))$
 - *Med*(*g*(*X*)) = *g*(*Med*(*X*))
 - The mode becomes g(mode)
- Only exception: g(x) = a + bx

• Then
$$E(g(X)) = g(E(X)) = a + bE(X)$$

Example

• Pick a random number from {1,2,3}

•
$$g(x) = x^2$$

- E(X) = 2, Med(X) = 2 and $mode = \{1, 2, 3\}$
- $E(g(X)) = \frac{14}{3}$, Med(X) = 2 and $mode = \{1, 4, 9\}$

Motivation Univariate: one random variable Multivariate: several random variables

Measure of dispersion

- The variance
 - $Var(X) = E((X E(X))^2) = \sum_{x} (x E(X))^2 f(x)$ if X is discrete
 - $Var(X) = \int_{X} (x E(X))^2 f(x) dx$ if X is continuous
 - How far is x from the average
 - Squared deviations since too small or too big
- Standard deviation = $(Var(X))^{\frac{1}{2}}$
- The inter quartile range: Q(0.75) Q(0.25)
 - Less sensitive for outliers

A (10) F (10) F (10)

Motivation Univariate: one random variable Multivariate: several random variables

Measure of dispersion

- Let g be an increasing function
 - $Var(g(X)) \neq g(Var(X))$
- However if g(x) = a + bx, then $Var(g(X)) = b^2 Var(X)$
 - Squared deviations
 - Adding a constant does not change dispersion
- Example
 - Pick a random number from $\{1, 2, 3\}$
 - $g(x) = x^2$

•
$$Var(X) = \frac{2}{3}$$

•
$$Var(g(X)) = \frac{98}{3}$$

< ロ > < 同 > < 回 > < 回 >

Motivation Univariate: one random variable Multivariate: several random variables

Central moments

Let X be a random variable

Var(X) is an example of a central moment of X

•
$$\mu_r = E((x - E(X))^r)$$

- Related to skewness if r = 3
 - Is zero for symmetric distributions
 - Puts less weight on outcomes that are closer to E(X)
- Kurtosis if r = 4
 - Measure for the thickness of the tails
 - Puts more weight on the extreme observations

Motivation Univariate: one random variable Multivariate: several random variables

• • • • • • • • • • • •

Compute the first four central moments for the following random variables

•
$$X \in \{0, 1\}$$
 and $f(X = 0) = \frac{1}{4}$

- $X \in \{a\}$ and f(X = a) = 1, with $a \in \mathbb{R}$
- Show that *Prob*(*a* < *X* < *b*) = *Prob*(*a* < *X* ≤ *b*)
 - = *Prob*($a \le X \le b$) if X is a continuous variable
- Argue that the same does not need to hold if X is discrete

Motivation Univariate: one random variable Multivariate: several random variables

Some remarks

- See the document overview_distributions.pdf for some important distributions
- Two more important functions for a continuous random variable *X*
 - The survival function: S(x) = 1 F(x)
 - E.g. x stands for time until transition
 - The hazard function: $h(x) = \frac{f(x)}{S(x)}$
 - E.g. x stands for duration of an event

 - Motivation
 - Univariate: one random variable
 - Multivariate: several random variables

Motivation Univariate: one random variable Multivariate: several random variables

Importance of multivariate setting

- In principle same machinery
 - Probability density function, expected value, ...
 - But relative position does not exist in general
 - Slightly more technical
- Allows to formally study new concepts
 - The independence of random variables
 - More general, the correlation between random variables
 - But also marginal and conditional pdf's
- We will focus on the bivariate case
 - Everything can of course be generalized

< 同 > < ∃ >

Motivation Univariate: one random variable Multivariate: several random variables

Two discrete random variables

Let X and Y be two discrete random variables

- E.g. X = male/female (i.e. X ∈ {0, 1}) and Y = score at the exam (i.e. Y ∈ {1, 2, ..., 20})
- The joint pdf f(x, y)
 - f(x, y) = Prob(X = x, Y = y)
 - $f(x,y) \geq 0$
 - $\sum_{x} \sum_{y} f(x, y) = 1$
- The joint cdf F(x, y)
 - $F(x,y) = Prob(X \le x, Y \le y) = \sum_{X \le x} \sum_{Y \le y} f(x,y)$
- Expected generalizations
 - Quantile function is not well-defined
 - Relative position? Inverse function?

A (10) A (10) A (10)

Motivation Univariate: one random variable Multivariate: several random variables

Two continuous random variables

Let X and Y be two continuous random variables

- E.g. *X* = temperature on September 24 and *Y* = liters of rain per square meter on September 24
- The joint pdf f(x, y)
 - *f*(*x*, *y*) = *Prob*(*a* ≤ *x* ≤ *b*, *c* ≤ *y* ≤ *d*)
 - $f(x, y) \geq 0$
 - $\int_x \int_y f(x, y) dy dx = 1$
- The joint cdf F(x, y)
 - $F(x,y) = Prob(X \le x, Y \le y) = \int_{-\infty}^{x} \int_{-\infty}^{y} f(s,t) dt ds$

Motivation Univariate: one random variable Multivariate: several random variables

The marginal pdf

Let X and Y be two random variables

- The pdf for one variable, irrespective of the value of the other variable
- E.g. the pdf for the exam score, irrespective of the sex of the student
 - The probability of having 12 is the sum of the probability of a female having 12 and a male having 12
- Formally
 - E.g. f_X(x) = ∑_y Prob(x = X, y = Y) if X and Y are discrete
 - E.g. $f_Y(y) = \int_x f(x, y) dx$ if X and Y are continuous

Motivation Univariate: one random variable Multivariate: several random variables

Independent variables

Let X and Y be two random variables

- The marginal distributions allow us to define independence
- X and Y are independent if and only if $f(x, y) = f_X(x)f_Y(y)$ for all values of x and y
- Remark that for dependent variables a similar relation between the joint pdf and the marginal pdf's does not exist

A ∰ ► A ≡ ► A

Motivation Univariate: one random variable Multivariate: several random variables

Independent variables

Example

- E.g. *X* = male/female and *Y* = score at the exam
- $Prob(X = Male) = 0.4 (= f_X(Male))$
- $Prob(X = Female) = 0.6 (= f_X(Female))$
- $Prob(Y = 12) = 0.3 (= f_Y(12))$
- $Prob(X = Male, Y = 12) = 0.10 \neq 0.4 \times 0.3$
- $Prob(X = Female, Y = 12) = 0.20 \neq 0.6 \times 0.3$
- There is dependence
 - E.g. females have a higher probability of obtaining 12
 - Since 0.20 > 0.18, not since 0.20 > 0.10!

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Motivation Univariate: one random variable Multivariate: several random variables

The conditional pdf

Let X and Y be two random variables

- The pdf of one variable for a given value of the other variable
- E.g. what is the probability of having 12, conditional on being female

• Formally:
$$f(y|x) = \frac{f(x,y)}{f_X(x)}$$

Motivation Univariate: one random variable Multivariate: several random variables

The conditional pdf

Let X and Y be two random variables

- Let X and Y be independent
 - Then $f(y|x) = f_Y(y)$ and $f(x|y) = f_X(x)$
 - Conditioning on x or y does not give extra information
- Reformulating the above:
 - $f(x, y) = f(y|x)f_X(x) = f(x|y)f_Y(y)$
 - This is the factorization of the joint distribution that takes dependence into account

A (1) > A (2) > A

Motivation Univariate: one random variable Multivariate: several random variables

The conditional pdf

Example

- E.g. *X* = male/female and *Y* = score at the exam
- *Prob*(*X* = *Male*) = 0.4 and *Prob*(*X* = *Female*) = 0.6
- Prob(Y = 12) = 0.3
- Prob(X = Male, Y = 12) = 0.10 and Prob(X = Female, Y = 12) = 0.20
- $Prob(Y = 12|X = Male) = \frac{0.10}{0.4} = 0.25$
- $Prob(Y = 12|X = Female) = \frac{0.20}{0.6} = 0.33$
- $Prob(X = Female|Y = 12) = \frac{0.20}{0.3} = 0.66$
- This is formally confirming our previous intuitive conclusion

Motivation Univariate: one random variable Multivariate: several random variables

Expected value

- The marginal and conditional pdf allow to compute the same numbers as before
- Expected value or mean
 - The expected value for X, irrespective of the value of Y
 - $E(X) = \sum_{x} x f_X(x) = \sum_{x} \sum_{y} x f(x, y)$ if X and Y are discrete
 - $E(Y) = \int_{Y} y f_{Y}(y) dy = \int_{X} \int_{Y} y f(x, y) dy dx$ if X and Y are continuous
- Conditional expected value or mean
 - The expected value for X, conditional on the value of Y
 - $E(X|Y) = \sum_{x} xf(x|y)$ if X and Y are discrete
 - $E(Y|X) = \int_{Y} yf(y|x) dy$ if X and Y are continuous
 - Regression: $y = E(Y|X) + (y E(Y|X)) = E(Y|X) + \epsilon$

Motivation Univariate: one random variable Multivariate: several random variables

Variance

- The dispersion of X, irrespective of the value of Y
- $Var(X) = \sum_{x} (x E(X))^2 f_X(x) = \sum_{x} \sum_{y} (x E(X))^2 f(x, y)$ if X and Y are discrete
- $E(Y) = \int_{y} (y E(Y))^2 f_Y(y) dy =$ $\int_{x} \int_{y} (y - E(Y))^2 f(x, y) dy dx$ if X and Y are continuous
- Conditional variance
 - The dispersion of X, conditional on the value of Y
 - $Var(X|Y) = \sum_{x} (x E(X))^2 f(x|y)$ if X and Y are discrete
 - $Var(Y|X) = \overline{\int_{Y} (y E(Y))^2} f(y|x) dy$ if X and Y are continuous
 - Homoscedasticity: the conditional variance does not vary

Motivation Univariate: one random variable Multivariate: several random variables

Covariance and correlation

Let X and Y be two random variables

- Summarize the dependence between *X* and *Y* in a single number
- The covariance of X and Y
 - Cov(X, Y) = E((X E(X))(Y E(Y)))
 - Compare to $Var(X) = E((X E(X))^2)$
 - A positive/negative number indicates a positive/negative dependence
 - Cov(X, Y) = 0 if X and Y are independent

A (1) > A (2) > A
Motivation Univariate: one random variable Multivariate: several random variables

< 47 ▶

- **→ → →**

Covariance and correlation

Let X and Y be two random variables

- Only sign of Cov(X, Y) has a meaning
 - Rescaling of X and Y changes Cov(X, Y) but of course not their dependence
- Correlation

•
$$r(X, Y) = \rho(X, Y) = \frac{Cov(X, Y)}{(Var(X))^{\frac{1}{2}}(Var(X))^{\frac{1}{2}}}$$

•
$$-1 \leq r(X, Y) \leq 1$$

- Both size and sign have a meaning
- This is not about causality!

Motivation Univariate: one random variable Multivariate: several random variables

Some remarks

Let X and Y be two random variables and $a, b, c, d \in \mathbb{R}$

- E(aX + bY + c) = aE(X) + bE(Y) + c
 - Similar as before and not influenced by (in)dependence
- $Var(aX+bY+c) = a^2 Var(X) + b^2 Var(Y) + 2abCov(X,Y)$
 - Extra term capturing the dependence of X and Y
- Cov(aX + bY, cX + dY) =acVar(X) + bdVar(Y) + (ad + bc)Cov(X, Y)
- Let X and Y be independent and g₁ and g₂ two functions
 - $E(g_1(X)g_2(Y)) = E(g_1(X))E(g_2(Y))$
 - Independence is crucial
 - In the above properties the linearity is crucial

< ロ > < 同 > < 回 > < 回 >

Motivation Univariate: one random variable Multivariate: several random variables

A final example: the bivariate normal distribution

- The joint distribution of two variables that are normally distributed
- The joint pdf:

$$f(x,y) = \frac{1}{2\pi\sqrt{\det(\Sigma)}} e^{-\frac{1}{2}(x-\mu_X,y-\mu_Y)\Sigma^{-1}(x-\mu_X,y-\mu_Y)^t}$$

• μ_X and μ_Y are the expected values of *X* and *Y* • $\Sigma = \begin{pmatrix} \sigma_X^2 & \rho \sigma_X \sigma_Y \\ \rho \sigma_X \sigma_Y & \sigma_Y^2 \end{pmatrix}$ is the covariance matrix • σ_X and σ_Y are the standard deviations of *X* and *Y* • ρ is the correlation

Motivation Univariate: one random variable Multivariate: several random variables

A final example: the bivariate normal distribution

Expected generalization

- Same structure as in the univariate setting
- X and Y can be dependent

< 🗇 > < 🖻

Motivation Univariate: one random variable Multivariate: several random variables

A final example: the bivariate normal distribution

Some results that only hold for the bivariate normal setting

- X and Y are independent if and only if $\rho = 0$
- The marginal pdf is again a normal distribution

•
$$f_X: X \sim N(\mu_X, \sigma_X^2)$$

• The conditional distribution is also a normal distribution

•
$$f_{X|Y}: X|Y \sim N(\mu_X + \rho \frac{\sigma_X}{\sigma_Y}(y - \mu_Y), \sigma_X^2(1 - \rho^2))$$
